Tricuspid valve, anterior leaflet Done

Valva atrioventricularis dextra (valva tricuspidalis), cuspis anterior

The tricuspid valve, one of the two atrioventricular valves in the heart, controls blood flow from the right atrium into the right ventricle. The tricuspid valve plays a vital role in the cardiac cycle, preventing backflow and ensuring one-way blood flow through the heart. As its name implies, this valve is formed by three triangular cusps (anterior, posterior, and medial) that are located at the right atrioventricular orifice. The cusps consist of membrane folds with intervening layers of fibrous tissue and have a smooth side and a rough side. The smooth atrial surfaces are directed toward the blood current from the atrium; the rough and irregular ventricular surfaces are directed toward the wall of the ventricle and attach to delicate tendinous cords called chordae tendineae. Atrial contraction forces blood out of the right atrium, through the atrioventricular openings, and into the ventricles. When the right ventricle contracts, the tricuspid valve is closed, preventing the passage of the blood back into the atria. The papillary muscles contract as well, which pulls the chordae tendineae, preventing the inversion of the valves into the right atrium.
